## DETAILED ACTION

### ***Claim Rejections - 35 USC § 103***

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-13 rejected under 35 U.S.C. 103(a) as being unpatentable over Ouderkirk et al. (U.S. 5,825,543). Ouderkirk et al. discloses an optical film where the index of refraction of continuous and disperse phases are substantially matched along a first orthogonal axis and substantially mismatched along a second orthogonal axis. The indices of the two regions differ by no more than 0.03 in the matched regions and differ by at least 0.07 in the mismatched regions. This type of scheme provides a high degree of control in providing optical bodies of consistent and predictable high quality performance. See column 7, lines 30 – 37. The range claimed by applicant for the length of the dispersed liquid crystal polymer particles is very broad and virtually non-limiting. The length of conventional liquid crystal polymer particles is well within this range. Furthermore, the chemical composition of the thermoplastic liquid crystal polymer as recited in claim 2 was well known and obvious for showing liquid crystal characteristics within a predetermined temperature range as evidenced by the disclosure of Hiji et al. (U.S. 5,953,089). See column 4, lines 55-67 and note the

chemical formula of the liquid crystal polymer. It would have been obvious to one of ordinary skill in the art at the time of invention to use this liquid crystal polymer in the optical film of Ouderkirk et al. because it exhibits liquid crystal characteristics within a specific temperature range.

### ***Response to Arguments***

Applicant's arguments with respect to claims 1-13 have been considered but are moot in view of the new ground(s) of rejection.
